Research Methods 1: Book: Research Methods in Applied Linguistics Author: Dr. H. Farhady Chapters 1 to 9 - 259 slides **Slide production: Dr. H. Iravani** Shahriar Center

Research Method I: Chapter 1

Chapter one: background

Sources of information:
1. Sensory experience
2. Expert opinion
3. Logic

Sensory information:
It is relative (not reliable)
It can be increased by multiple sensation made by multiple people
It is verifiable

Research Methods 1 Expert opinion is 1. the easiest and most available source 2. subjective: it should be investigated empirically

Expert Opinion

Authority

Tradition

Research Methods 1 Logic (the first scientific approach) **Aristotle founded deductive** reasoning = natural axiomatic facts \rightarrow conclusion

An example:
1. All men are mortal (major premise)
2. Aristotle is a man (minor premise)
3. Aristotle is mortal (conclusion)

Deduction: General

Specific

Induction: Specific

General

Deductive reasoning was founded by Frances Bacon: moving from data and observable facts to conclusions

Enumeration: all instances are observed and counted, then conclusion is drawn

Scientific approach seeks for a compromise between Deduction and Induction

Research Methods 1 Scientific Method: It was derived from POSITIVISM. Natural positivism only relies on observable natural phenomena.

The first principle is verifiability: Something can be meaningful if it is observable. Therefore, feelings, values and attitudes were nonobservable and *not researchable*.

Positivism was questioned in human sciences since human behavior is so complex. This led to Post Positivism.

Research Methods 1 Research is a systematic approach to answering questions.

Research Methods 1 Chapter 2 Principles of Research

Characteristics of Research

Research is:

Systematic
 Logical
 Reductive
 Replicable
 Generative

Research is systematic: It is a structured process Researchers believe in <u>constancy</u> (regulation) and <u>uniformity</u> in natural events.

In physical sciences: We have maximum constancy and uniformity because elements are (1) concrete, (2) observable and (3) controllable.

In human sciences: We have abstract phenomena mixed with subjective, personal and relative features.

Research is logical:

a researcher should think, speak, act, and conclude *logically*.

Research is Reductive

Conceptual

Conceptual implication: From many instances to generalization (similar to what a child does)

Practical implication: A researcher's findings forms the basis of other researches (additivity / transmission of human knowledge).

Replicability: conducting a similar research (1) in a new environment,
(2) with a new group of subjects,
(3) at a different time

Three possible outcomes of replication: previous research is
(1) confirmed,
(2) partially confirmed,
(3) contradicted

Replication acts as a validation technique. Therefore, reporting can be reliable and complete

Generativity: it is the key to scientific development. Research opens up new horizons and new borders of science. One question leads to many.

Goals of research:
(1) description
(2) prescription
(3) improvement
(4) explanation

Description: Describing natural or man made phenomena (describing the relationship between IQ and language proficiency)

(1) how language is originated
(2)what the structure is (3) how
language works (4) how language
has changed (5) how language is
related to culture and society

Research Methods 1 Description is done through: (1) Observation (2) Tests (3) Questionnaire (4) Other instruments

Prediction (second goal of research): description should lead to prediction (predicting one's success according to his IQ)

Improvement (goal of research): the final end of research is to improve the quality of life (how to improve students' listening comprehension).

Explanation (goal of research): Explanation goes beyond description. After you describe that girls are better L2 learners you explain the reasons.

By explanation, we try to find out why things happen the way they do. This leads to theorizing (from generalization to theory making).

Research Methods 1 Kinds and methods of research: Kind refers to the nature of research Method refers to the procedures used in research

Kinds of research:(1) Exploratory (pure / applied)(2) Confirmatory (pure / applied)

Methods of research:
(1) historical
(2) descriptive
(3) experimental

Exploratory research: Exploring the mysteries of the universe

Confirmatory research: Exact or partial replication of previous research for confirming previous researches (more common in research in language learning).

•Pure research: research for the sake of research. Research is the goal. Applicability is not important. Pure research adds to human knowledge.

•Applied research concerns the utilization of the findings. It is responsible for the good or evil of the findings (atomic energy)

Examples: Exploratory pure: finding out the number of vowels in a new language in Amazon.

Exploratory applied: the effect of chemicals on fluency (useful for lecturing and interviews)

Confirmatory pure: to see if Broca and Wernicke (two brain areas) also work in very young children.

 Confirmatory applied: to find out if the correlation between IQ and success in L2 learning is positive. If yes, we can use this in our placement procedure.

Research in natural sciences is more concrete (on sodium).
Research in human sciences is more abstract and multi-aspected (on motivation)

Changing factors in human sciences: age, gender, family, economy, natural / social environments, learning strategies, emotional / physical / mental conditions

Steps in conducting research:
1. forming the questions
2. selecting the method
3. testing the hypothesis
4. writing the report

Forming a research question:
Research comes from searching and we always search for an answer.
<u>Questions</u> should be converted into a <u>hypothesis</u>

A hypothesis is a tentative (uncertain) statement about the outcome and results of the research.

A hypothesis comes from the researcher's expectations generating from: (1) his knowledge (2) the review of the literature

A hypothesis expresses a relationship between two or more factors or variables.

Research Methods 1 •Question: what is the relationship between knowledge of grammar and fluency? •Hypothesis: better knowledge of grammar leads to more fluency.

Research Methods 1 Question: what is the relationship between IQ and ability to learn L2? **Hypothesis: more intelligent** students are better language learners.

Research Methods 1 Selecting a good method: A method is selected based on a design (will be discussed later)

Testing the hypothesis: First data should be collected, then analyzed through statistical techniques, and the results should be interpreted.

Preparing the report (last step in conducting research): to inform the others about the results we write a well organized report.

Section two Formulating Research Questions

Research Methods 1 Chapter 3

Areas of Research in Language Education

Research Methods 1 Areas of research in TEFL: 1. teaching (education) 2. language (linguistics) 3. learner (social environment) 4. learning (psychology)

Research Methods 1 The scope of applied linguistics? It includes all branches of linguistics. Branches of linguistics intersect with other discilines.

Questions in linguistics:
1. phonology
2. morphology
3. syntax
4. semantics

Questions in Methodology

 Curriculum development
 Syllabus design
 Teacher training
 Material preparation
 Methodology
 Testing

Research Methods 1 Questions on factors influencing TEFL: **1. Cognitive factors** 2. Personality factors **3. Social factors**

Cognitive factors:
A. process (general mental activity)
B. style (individual mental activity)
C. strategy (idiosyncratic mental activity)

Research Methods 1 Different types of learning: A. signal learning **B.** stimulus response learning **C. verbal association D.** multiple discrimnation

E. concept learningF. problem solvingG. discovery learningH. rote leaningi. inductive learning

J. deductive learning K. meaningful learning The list is open

When two or more languages are learned, the cognitive processes:
A. transfer (L1 to L2 or vice versa)
B. interference
C. overgeneralization

•Transfer, interference, overgeneralization and similar cognitive processes are discussed in <u>contrastive analysis</u> and <u>error</u> <u>analysis</u>.

Research Methods 1 Style (another cognitive factor): Persistent differences in cognitive functioning such as: A.field dependent (totality) **B.field independent(individual parts)**

Research Methods 1 Brain (a cognitive factor):

A. left hemisphere dominance B. right hemisphere dominance

Affective factors (emotions and feelings):

A. interpersonal interactionsB. intrapersonal interactions

Levels of Affectivity (Brown 1987)

A. receivingB. respondingC. valuing

D. organizing the values
F. identifying oneself with value system

Research Methods 1 Self esteem (affective factor): The way a person evaluates himself. Positive attitude is helpful (self confidence)

Research Methods 1 Inhibition (affective factor): The defense system one builds around himself.

Alienation (affective factor): Critical learner vs. performing learner; first language vs. second language; learner vs. teacher; learner vs. learner; L1 culture vs. L2 culture

Research Methods 1 Anxiety (affective factor):

A. debilitative anxietyB. facilitative anxiety

Motivation (affective factor): an inner force, emotion or desire to achieve a goal
A. integrative
B. instrumental

Integrative motivation: learner wants to associate himself with L2 culture (≠ alienation)

Research Methods 1 Instrumental motivation: Learner wants to learn L2 for further education, finding a job, reading manuals, watching films,

Research Methods 1 Social factors (questions in TEFL) Widdowson (1979) makes a distinction: A. Usage: linguistic forms **B. use: communicative functions of** language

Research Methods 1 Attitude (social factor): A. positive attitude to L2 (integration) **B.** negative attitude to L2 (alienation)

Acculturation (social factor) Adding a culture, or at least becoming identified with a new social group [culture shock vs. anomie] (Hudson 2000).

Questions in language and literature
(language is a medium to understaning literature):
A. relationship between the two
B. readability formulas

 C. linguistic aspect of literary text (lexical difficulty and syntactic complexity)
 Lexicon → Syntax → Culture → Literature

Language and technology:
A.Impact of technology on education
B. utilization of mechanical and electronic devices
C. programmed instruction

Research Methods 1 D. content analysis through technological software

Research Methods 1 •Questions in language and politics (policy making): •A. national language vs. local languages B. selecting a second language C. formal vs. informal languages

D. coining new words
E. finding equivalent words
F. deciding when to start teaching L2

Research Methods 1 G. deciding how to deal with L2 culture H. deciding on an L2 entrance level for university students

Research Methods 1 Chapter 4 The Research Question

All research projects start with a question

Students fail to make good questions because:

A. they do not observe well.

Research Methods 1 B. they take written and spoken materials as truth. C. they can not find a topic

Research Methods 1 Characteristics of a good research question: 1. interest 2. relevance 3. manageability

Interest:

If the researcher is interested in the topic he conducts it with great eagerness and care.

Relevance:

Research should have short term or long term relevance to the needs of the society (research on African or Iranian subjects?).

Manageability:one should manage to conduct the research (parameters: man power; expertise; financial support; time; equipment; social and educational limitations)

Research Methods 1 Narrowing down the topic: How is L2 learned? In what order does an Iranian female young adult learn English vowels?

Why do we prefer "in what order" to "how"?

Quantity (how many, how often, how fast, ...) words are easily measured.

Research Methods 1 What is the best method? (broad) Would Audiolingual method lead to a better test score than Grammar **Translation method for Iranian** female students in Rahnamai?

Research Methods 1 A question involves two variables. What is the relationship between IQ and achievement in vocabulary learning for Iranian **English learners?**

Types of research question:
1. Descriptive
2. Correlational
3. Cause-Effect

Research Methods 1 Descriptive Qs are in search for A. Frequency, B. Duration, C. Intensity, D. Range, and **E.** Sequence of an event or behavior.

Research Methods 1 Correlational questions: The degree of relationship between two or more variables. What is the relationship between X and $\underline{\mathbf{Y}}$?

Cause-Effect questions require experimentation.

Causal relationship between two or more factors as in: "What is the effect of <u>X</u> on <u>Y</u>?"

Research Methods 1 Formulating a hypothesis: A hypothesis is an uncertain or tentative answer to the question

Research Methods 1 Question: what is the relationship between X and Y? Hypothesis: there is a relationship between X and Y. **X=IQ Y** = Accuracy in Grammar

•After collecting data and testing the hypothesis, the hypothesis is supported, rejected, or partially supported.

Hypothesis

Directional Alternative Nondirectional Null

 Directional Hypothesis: the researcher predicts a positive or negative relationship between two variables.

Example: H₁: There is a positive relationship between IQ and Second language acquisition.

Example: H₁: There is a negative relationship between <u>age</u> and <u>Second language</u> acquisition.

Nondirectional or null hypothesis (the researcher tries to reject it): No particular relation is predicted or suggested.

Example: H₀: There is no relationship between the <u>age</u> of learner and the <u>speed of</u> <u>learning L2 vowels</u>.

Research Methods 1 Chapter 5 Review of Literature

• Review of literature: searching for documents and reports related to the topic (additivity).

Research Methods 1 A. How comprehensive should it be? **B.** How many sources? **C. What kind of sources? D.** Where to find sources? **E.** How to read?

Research Methods 1 Goals of Literature Review? 1.a. To put the topic within a scientific perspective. **1.b.** To help formulate a better question (deleting or adding a factor).

2.a. To avoid mere duplication
2.b. To find new unexplained items.
3. To avoid inadequacies of previous research (e.g., the proficiency test was not standard).

The focus of literature review should be on theory, method and data analysis of the previous research. Theory is the foundation of all research.

Method includes (1) subjects, (2) the instruments to collect data, (3) the procedures, (4) kind, method and design of research and (5) statistical analysis.

 Statistical analysis includes the presentation and interpretation of results 9section four).

Finding the source of information:
A. Encyclopedia
B. Abstracts
C. Books and articles
D. Dictionaries, yearbooks, journals

Research Methods 1 Periodicals in TEFL: (1) Language Learning (2) TESOL **Quarterly (3) Modern Language** Journal (4)Language Teaching **Journal (5) Linguistics**

(6) Applied Linguistics (7)
International Review of Applied
Linguistics (8) Language (9)
Language Testing (10) Language
Acquisition

When recording bibliographical information, try to include:
1. Full name of the author
2. Full title of the document
3. Place, publisher, date 4. Pages

When taking notes, take care:
1. Do not copy
2. Do not ignore unimportant notes
3. Keep them in an organized way
4. Collect comprehensive notes

The process of Note Taking:
1. Write legibly in ink
2. Write on one side of the card
3. Use abbreviations
4. Label the cards for later use

Research Methods 1 American Psychological Association (APA) Format: Tuckman, B. (1972). Conducting educational research. New York: Harcourt Brace.

Research Methods 1 Modern Language Association (MLA) Format: Tuckman, B. Conducting **Educational Research. New York:** Harcourt Brace, 1972.

Research Methods 1 Chapter six Characteristics of a variable

A hypothesis (Null/Alternative) involves the relationship between two or more variables:
"What is the effect of <u>IQ</u> on <u>language learning</u>?"

Variable: an attribute changing from person to person, object to object, or time to time (e.g., size, height, temperature, IQ, knowledge of grammar,...)

Variable

Concrete (size)

Abstract (motivation)

Variable

Discrete (handedness) Continuous (height, size)

Examples: *Handedness*: discrete and concrete *Cognitive style*:discrete and abstract *Intelligence*: continuous and abstract *Height*: continuous and concrete

We narrow down the topic by reducing the number of variables.
A topic becomes manageable by specifying the features of the variables.

Research Methods 1 Variables should be defined from: (1) A <u>theoretical</u> perspective. a variable has a theory behind it (2) An operational perspective. It has some measurable features.

Research Methods 1 Measurement scales of variables: 1. Nominal scale 2. Ordinal scale **3. Interval scale** 4. Ratio scale (NOIR)

Nominal scale (for concrete variables, all or nothing nature): Numbers (without mathematical values) are used to label variables.

Ordinal scale (not easily measured, abstract as for happiness, interest): people or objects are ranked from high to low (very happy, happy, unhappy, very unhappy).

 Different cut off points are labeled by numbers. Numbers are meaningful but they do not specify the differences accurately.
 Distances are not equal.

Interval scale (similar to ordinal scale): It determines how much of an attribute exists. The distances are equal and have mathematical values (as in test scores)

The distances are theoretically equal but not in practice (interval scale is the most objective scale in human sciences).

Research Methods 1 •Ratio scale (exclusive in natural sciences): •It has true zero (and minus points) and equal distances as for temperature. It is not used ion social sciences.

Convertibility of measurement scales:

•A variable may be measured on different scales depending on the nature of research.

Convertibility works from <u>interval to</u> <u>ordinal or nominal scales</u> as in language proficiency: interval scale (scores of 1 to 20) can be converted to ordinal and nominal scales.

Functions of variables Variables are attributes of people or things (e. g., eye color, language ability, fluency, knowledge of grammar, pronunciation).

There is no relationship between (variable 1)<u>teaching listening</u> <u>comprehension</u> and students' (variable 2)<u>achievement in</u> <u>language proficiency</u>.

Research Methods 1 After selecting the variables, they should be operationally defined. variables

Independent

Dependent

•Achievement on language proficiency is a dependent variable (it is observed and measured but not manipulated).

The instruction on listening comprehension is an independent variable (it is manipulated through time, method, subjects, period, materials, teachers, ...).

Research Methods 1 Independent variable (cause)

Dependent variable (effect)

Research Methods 1 Independent v.

Dependent v.

Research Methods 1 •Gender is a *moderator variable* •A moderator variable modifies the relationship between the independent and dependent variables (but it can not be manipulated).

Independent v.

Control v.

Dependent v.

Moderator v.

A variable which is controlled and kept constant to neutralize its effect on the outcome is called the *control variable*.

(e.g., language background).

Research Methods 1 Independent Control Moderator

Intervening v.

Dependent v.

Intervening variable

(not measurable or observable) stands between the independent and dependent variables (e.g., learning an underlying factor).

Research Methods 1 SECTION TRHREE

SELECTING AN APPROPRIATE RESEARCH METHOD

After the selection and operational definition of variables, the method should be determined. A method is the procedure used to answer the question and test the hypothesis.

Research Methods 1 A method should be (1) time, (2) energy and (3) cost effective. **Historical method** >Descriptive method >Experimental method

CHAPTER 7 HISTORICAL METHOD OF RESEARCH

Research Methods 1 TO STUDY THE PAST IS THE BEST WAY TO UNDERSTAND THE PRESENT

•Literature review is different from historical method. The former is to collect what others have done about a topic.

 Historical research is a systematic collection and an objective evaluation of the past events to test the hypotheses about causes, effects or trends in the past.

Historical research:
deals with nonliving subjects
has a different procedure
gives insight
finds solutions for future problems

Research Methods 1 has a question and hypothesis is very common in human sciences may not produce generalizations doesn't operate in a closed system

Historical m. involves these steps: 1. Formulating the problem, 2. formulating hypotheses, 3. collecting data. 4. criticizing the data, 5. interpreting the findings.

Research Methods 1 Formulating a problem: Explaining the past and predicting

Explaining the past and predicting the future are the basic goals.

Different sources are researched in historical method (no scientific measurement may be involved): 1. official records, 2. nonofficial records, 3. physical remains

Nonofficial records may include: 1. personal records, 2. tales, letters, contracts, 3. drawings, paintings, 4. book, articles, and 5. mechanical records such as tapes.

Historical sources

Primary

 Primary sources of information are produced by actual participants or witnesses, dead or alive (e.g., laws and news papers).

Secondary sources on information are obtained indirectly (less reliable). Historical sources should be examined for <u>authenticity</u> and <u>truthfulness (CRITICISM).</u>

Criticism

Internal

•External criticism deals wit the authenticity (genuineness) of the materials. Is the document real? Is it really written by the claimer?

Research Methods 1 Internal criticism deals with the accuracy of the content. Isn't it biased? •Historical sources should be reconfirmed.

Research Methods 1 Accuracy can be checked by : • considering the knowledge of the writer • examining the time elapse between the event and its creation.

Research Methods 1 checking the bias and motives of the writer cross validating the data

Research Methods 1 CHAPTER 8 **DESCRIPTIVE METHOD** OF RESEARCH

Research Methods 1 Descriptive method involves the description and interpretation of the phenomena.

Descriptive method is important because:

1. A great number of research in education is descriptive (since experimentaion is difficult).

Research Methods 1 2. descriptive method has different techniques suitable for different questions.

Descriptive Methods

Interrelational

Developmental

Survey

Survey methods involves asking direct questions to 1. describe the nature of conditions (describing the composition of students),

2. Identifying standards (describing the ideas of students and their progress in a quality university), and

3. Determining the relationship between conditions (describing the family pressure on students and their choice of majors).

Surveys may vary in (1) complexity (frequency counts vs. describing the nature of L1 acquisition), and (2)scope (a school vs. the whole country).

Different factors to consider: 1. Specifying the purpose (narrowed down)

2. Selecting the type of information (facts, opinions, behaviors).

Facts: age, race, gender, income, period of education (verifiable)
Opinion: feelings, likes, dislikes (non-verifiable)
Behavior: how frequent one does an action (verifiable)

Research Methods 1 The third factor is the instrument in data collection: • Questionnaire Interview Observation

Survey Methods:
1. School Survey
2. Community Survey
3. Public Opinion Survey

Research Methods 1 School Survey

Related issues: learners/teachers characteristics; learning process; legal and managerial matters,; physical settings.

In School Survey affective factors can be surveyed (motivation, attitude, self esteem, socioeconomic background, ...)

Research Methods 1 Community Surveys Similar to school survey (health service, employment, situation of minority groups, ...)

Research Methods 1 <u>Public Opinion Surveys</u> Surveys on educational, political and industrial matters for decision making

Research Methods 1 Interrelational Methods: involve the <u>discovery of the</u> relationship among factors or variables.

Research Methods 1 Four methods of interelations: **1.** Case studies 2. Field studies **3.** Correlational studies 4. Causal-comparative studies

Case Studies: deal with the investigation of a social unit. Observing the way a child acquires his L1 is an example.

A <u>Survey</u> involves collecting data on a few factors from many people but a <u>Case Study</u> is narrow in scope but more exhaustive and qualitative.

Field Studies: deals with the investigation of the features of a phenomenon.

Research Methods 1 Key terms in Field Studies: Direct Observation Naturally Occurring Event (naturalistic method)

Field linguistics: Collecting data on nonverbal behavior, body movement, facial expression, eye contact, posture and gesture

Research Methods 1 Two kinds of sampling in field research: **1.** Continuous time sampling (observing the library behavior of students over the term)

2. Time point sampling (observing the students' behavior around midterm or final exam)

Research Methods 1 Correlational Studies Deal with the discovery, measurement, or determination of the degree of relationship between two variables.

Research Methods 1 Negative Correlation: The magnitude of variable1 increases while that of variable 2 decreases (accuracy in speaking and grammar errors)

Research Methods 1 Positive Correlation: The magnitude of variable1 increases while that of variable 2 also increases (height and weight)

Factors to consider:
1. Data should collected on every single subject to determine the degree of relationship.

2. the interpretation of a given relationship should be done cautiously. How do you interpret a high relationship between intelligence and achievement?

Three possibilities:
1. Intelligence affects achievement
2. Achievement affects intelligence
3. A third factor affects both

Correlation does not necessarily mean causation (a cause-effect relationship). Both height and weight are under the effect of nutrition (the third factor).

•The third factor: <u>Gotogetherness</u> (correlation) may be without special reasons. The correlation should be interpreted based on the theory (height and fluency).

Research Methods 1 To find the causal relationship we conduct <u>causal-comparative</u> research (also done through experimental methods).

 Causal comparative and correlational research are both descriptive but the former involve two or more groups and one independent variable and comparison.

Correlational studies involve two or more variables and one group and looks for gotogetherness.

Both causal comparative and experimental methods involve cause-effect relationship and group comparison. In the former we do't manipulate the variables.

In an experimental research we create the cause by offering different treatments-independent variable (to see the effect of vitamins on intelligence).

In an causal-comparative study (expost-facto), we observe the effect and find out the cause. To find that preschool language learning affects the students' achievement.

Research Methods 1 Problems of causal-comparative studies: No control over variables No single factor may be the cause **Contradictory findings may happen**

Research Methods 1 Developmental Methods Deals with the changes that take place over time. 1. longitudinal method 2. cross-sectional method

In Longitudinal studies, the development is investigated over a long period of time at special intervals (language acquisition,cognitive development).

In cross-sectional method, we obtain data in a short period of time or even in one session (selecting many children at different ages and collecting data).

Cross-sectional studies involve many subjects in little time while longitudinal studies involve few subjects over a long time.

Research Methods 1 CHAPTER 9 **EXPERIMENTAL METHOD** OF RESEARCH

 The experimental research does not have the shortcomings of the Historical and descriptive methods. Historical and Descriptive methods do not lead to strong conclusions about the variables. They look at what happened in the past or what is happening at present. Through Historical and Descriptive Methods, we can not make cause and effect relationships among variables. Experimental method is the peak of scientific research

Principles of the Experimental Method

Certain features should exist: randomization, pretesting, having experimental and control group, offering a treatment to the experimental group and a placebo to the control group, and post testing. • Depending on the extent of using these requirement, three types of experimental methods have emerged: True Experimental (if all requirements are met)
 Pre-experimental (if one or two requirements are not met) 3. Quasi-experimental (we try to compensate for the violation of certain principles)Each will be discussed separately.

 True Experimental Method
 The strongest method in education. Here all requirements should be met. If we want to see the effect of a new method of teaching dialogues on speaking ability.
1. A random group of students should be selected. Why?

2. The researcher should find a control group (taught by a traditional method).

3. We need to give a pre-test to prove that all students had almost equal abilities at the beginning. 4. the researcher needs a post test to prove the privileges of his innovative group. If the experimental group performed better, the claim is confirmed.

Validity: If an answer to a question is (1) verifiable and (2)applicable,it is valid.

 Verifiablity: similar research leads to similar results.
 Applicability: the results of a research are applicable to similar situations outside the experiment (generalizablity).

Internal

External

Internal validity: The extent to which the changes in the dependent variable are due to the manipulation of the independent variable (and not other factors). •To ensure internal validity, the researcher should control as many variables as possible. Threats to internal validity: **1. History effect (attending extra** classes). 2. Maturation **3.** Testing effect (pre testing and post testing)

4. Selection effect5. Mortality effect (loss of subjects/attrition).

External validity: The extent to which the outcomes would apply to other similar situations (generalizablity from sample to population). The more controlled the conditions are, the more internal validity can be obtained and the less the external validity results. If one of the requirements of True Experimental research is nor met, the method changes to Pre-Experimental method. **Pre-Experimental Methods: 1.** One-shot case study (no control group) 2. One-group pretest post test study 3. Intact group study (without random selection)

 Quasi-Experimental methods are alternatives for True-Experimental methods. Time-Series Study (the most
common type of Quasi-
Experimental method):T1T2T3XT4T5T6

Equivalent-Time Series Method: <u>T1 X T2/T3 O T4/T5 X T6/T7 O T8</u>,
